# **Description**

move is a package that contains functions to access movement data stored at <a href="www.movebank.org">www.movebank.org</a> as well as tools to visualize and statistically analyse animal movement data. Move addresses movement ecological questions.

### **Details**

The package implements classes for movement data and supports

- Creation of Move objects (see Move-class) representing animals and their track
- · Calculation of utilization distributions using the dynamic Brownian bridge Movement Model
- Plotting tracks, utilization distributions and contours
- Access to raster, n.col, projection and coordinates
- Different CRS projection methods such as longlat or aeqd

### I. Creating Move objects

Move objects can be created from files with the function:

move To create an object containing one animal track moveStack To create an object containing multiple move objects getMovebankData To create a Move or a MoveStack object with data from Movebank

### II. Calculation of the utilization distribution

With the function below the dynamic Brownian Bridge Movement Model calculates the utilization density from a Move object:

brownian.bridge.dyn To calculate the utilization density

4 .UD-class

### III. Accessing values

coordinates Track-coordinates of the Move Object

as.data.frame A data.frame with the important data of the Move Object

n.locs The number of locations

time.lag The time lags between the locations projection The projection method of the track/raster

### IV. Plotting data

The track or the utilization distribution can be plotted with the following functions:

plot plots the utilization distribution with fixed width and height ratio (see DBBMM-class)

or the track (see Move-class)

image plots the utilization distribution fitted to the window contour adds the contours of utilization distribution to a plot

### Author(s)

### Author(s)

Marco Smolla

6 angle

angle

angle information from a track or track stack

# **Description**

This function returns a summary about angle related measurements of a track or track stack. These are: average azimuth, variance of azimuth, standard error of azimuth.

# Usage

```
## S4 method for signature '.MoveTrackSingle'
angle(x)
  ## S4 method for signature '.MoveTrackStack'
angle(x)
  ## S4 method for signature '.MoveTrackSingle'
angleSummary(x)
  ## S4 method for signature '.MoveTrackStack'
angleSummary(x)
```

# **Arguments**

Х

Move or MoveStack object

### Value

Angles in degrees

### Author(s)

Marco Smolla

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
## Not run:
    stack <- moveStack(list(leroy,leroy))
    angle(leroy) #angles from a Move object
    angle(stack) #angles from a MoveStack object
    angleSummary(leroy) # summary of angle measures of a Move object
    angleSummary(stack) # summary of angle measures of a MoveStack object
## End(Not run)# failed on cran build</pre>
```

as.data.frame 7

as.data.frame

Return a Data Frame

# **Description**

Function to create a data frame with the information of a spatial data frame contained in the Move object.

# Usage

```
## S4 method for signature 'Move' as.data.frame(x,...)
```

### **Arguments**

x an object of the Move-class

... additional arguments to be passed to or from methods

#### **Details**

as.data.frame extracts the sdf argument from a Move object (see Move-class)

### Author(s)

Marco Smolla

### **Examples**

```
## create a move object
data <- move(system.file("extdata","leroy.csv.gz",package="move"))[99:150,]
## returns a data.frame with all information stored in the spatial data frame of the move object
head(df <- as.data.frame(data))</pre>
```

brownian.bridge.dyn

Creates a DBBMM object

# Description

The brownian.bridge.dyn function uses a Move object (see Move-class) to calculate the utilization distribution, UD, of the given track. It uses the dynamic Brownian Bridge Movement Model (dBBMM) to do so. The dBBMM has the advantage over the other Brownian Bridge Movement Model that changes in behavior are accounted for. It does so by using the behavioral change point analysis in a sliding window. For details see references.

8 brownian.bridge.dyn

#### Usage

### **Arguments**

object an object of the Move-class

raster a RasterLayer object or numeric value. A numeric value for raster is in-

terpreted as the resolution of the square raster cells (in map units); the according raster will be calculated internally. If a RasterLayer is provided the

brownian.bridge.dyn starts to calculate the UD based on that raster.

dimSize numeric. dimSize is only used if raster is not set. dimSize is interpreted as the

number of cells along the largest dimension of the track. The according raster

will be calculated internally. Default is 10

location.error single numeric value or vector of the length of coordinates that describes the

error of the location (sender/receiver) system in map units, or a character string

with the name of the column containing the location error.

margin The margin used for the behavioral change point analysis.

window.size The size of the moving window along the track. Larger windows provide more

stable/accurate estimates of the brownian motion variance but are less well able

to capture more frequent changes in behavior.

ext Describes the amount of extension of the bounding box around the animal track.

It can be numeric (same extension into all four directions), vector of two (first x, then y directional extension) or vector of four (xmin, xmax, ymin, ymax extension). Default is .25 (extends the bounding box by 25%). Only considered

in combination with a numeric raster argument or the dimSize argument.

bbox vector with 4 numbers defining a bounding box for the raster

... for additional arguments, for example burstType which is a character vector with

the name of burst type for which the UD needs to be calculates in case a bursted

brownian bridge is calculated

#### **Details**

There are four ways to launch the brownian.bridge.dyn function which are as follows:

1. Use a raster

A RasterLayer object is set for the raster argument which is then used to calculate the UD.

2. Set the cell size

To set the cell size, set a numeric value for the raster argument without providing dimSize. The numeric raster argument is used as the cell sizes of the raster.

3. Set the number of cells (col/row)

To set the number of cells along the largest dimension a numeric dimSize argument can be set.

4. Using default raster

brownian.bridge.dyn 9

When there are no values set, the default raster value is used to calculate and create a RasterLayer object, which is returned to the same function. Note: depending on the size of the area of interest, the default cell size value can result in a large number of cells which may take a very long time to calculate!

The function prints an estimate of the size of the computational task ahead. This can give an indication of how long the computation is going to take. It should scale roughly linearly with the duration of the computations. In our experience 10e9 takes about a minute with an average laptop.

There is one further argument that can be given: time.step. It correspond to the size of the timer intervals taken for every integration step (in minutes). If left NULL 15 steps are taken in the shortest time interval.

#### Note

Note that the first few and last few segments of the trajectory are omitted in the calculation of the UD since a lower number of estimates for the Brownian motion variance are obtained for those segments.

Thanks to Ryan Nielson for making the BBMM package that served as an example for early versions of this code.

brownian.motion.variance.dyn

Calculates the dynamic brownian motion variance

# **Description**

A function to calculate the dynamic brownian motion variance for a movement track. It can be used by advanced programmers to program against.

# Usage

```
## S4 method for signature '.MoveTrackSingle,numeric,numeric,numeric'
brownian.motion.variance.dyn(object, location.error, window.size, margin)
```

### Arguments

object An object of the Move-class, that can be used for variance calculation. It needs

to be in a flat coordinate system.

location.error A numeric vector with the location error.

window.size The window size used for the variance calculation.

margin The margin size used for variance calculation.

# Value

An object of the type dBMvariance is returned

### Author(s)

Bart Kranstauber

### References

Kranstauber, B., Kays, R., LaPoint, S. D., Wikelski, M. and Safi, K. (2012), A dynamic Brownian bridge movement model to estimate utilization distributions for heterogeneous animal movement. Journal of Animal Ecology. doi: 10.1111/j.1365-2656.2012.01955.x

brownian.bridge.dyn
```

burst 11

burst

Bursting a track

# **Description**

Bursting a track by specified variable

# Usage

```
## S4 method for signature 'Move, character' burst(x, f, ...)
```

### **Arguments**

x a Move object

f a character, factor, or numeric that indicates how to burst the coordinates of a Move object. It must be one shorter than the number of locations, because there

are always one less segments of a track than coordinates

... not used

### **Details**

The burst function bursts (divides) a track in segments that are specified by the burstIDs (e.g. behavioral annotations). It allows to investigate different parts of a track according to supplied variables like day and night, movement and rest, and so on.

# Author(s)

Marco Smolla

```
test <- move(system.file("extdata","leroy.csv.gz", package="move"))
behav <- c(rep(1:4,each=200), rep(5, 118))
testb <- burst(x=test, f=behav)
head(testb)</pre>
```

12 contour

citations

Extract the citation of a Move or MoveStack object

### **Description**

The citations method returns or sets the citation of a track from a Move or MovesStack object.

# Usage

```
## S4 method for signature '.MoveGeneral'
citations(obj)
## S4 replacement method for signature '.MoveGeneral'
citations(obj) <- value</pre>
```

### **Arguments**

obj Move or MoveStack object value citation from class character

### Author(s)

Marco Smolla

# **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))

citations(leroy) #get the citation from a Move object
citations(stack) #get the citation from a MoveStack object
citations(leroy) <- "No paper available" #change the citation and set it for a Move object
citations(stack) <- "Nothing to cite" #change the citation and set it for a MoveStack object</pre>
```

contour

Contour plot

### **Description**

Contour plot of a RasterLayer from a DBBMM object.

# Usage

```
## S4 method for signature '.UD'
contour(x, ...)
  ## S4 method for signature '.UDStack'
contour(x, ...)
```

coordinates 13

### Arguments

x an object of the DBBMM-class or DBBMMStack-class... additional arguments like levels and nlevels, see details

#### **Details**

The contour function creates a shape of the area in which the animal can be found by a certain probability (i.e. the 90% contour describes the area in which the animal can be found with the 90% probability). One or several probabilities can be set with levels (numeric or vector of values between 0 and 1). If no value is set all contour lines are returned. You can also use nlevel to set a number of fixed distance levels.

To change parameters of the contour or line plotting use the usual parameters of the plot function (like lwd, lty, and so on). You can also add the contour lines to a plot by adding add = TRUE.

# Author(s)

Marco Smolla

### **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
## to add a 50% and 95% contour to a plot from DBBMM object dbbmm
plot(leroydbbmm)
contour(leroydbbmm, levels=c(.5,.95), add=TRUE)
```

coordinates

Extract the track coordinates from a Move/MoveStack object

# **Description**

The coordinates method extracts the coordinates of a track.

# Usage

```
## S4 method for signature 'Move'
coordinates(obj,...)
```

# **Arguments**

obj A valid Move or MoveStack object
... Additional arguments, see Details

### **Details**

Returns a matrix with the coordinates of the track in a Move or MoveStack object.

14 corridor

### Author(s)

Marco Smolla

### **Examples**

```
## create a move object
data <- move(system.file("extdata","leroy.csv.gz",package="move"))
## extract the coordinates
coords <- coordinates(data)</pre>
```

corridor

Corridor

### **Description**

Corridor identifies movement track segments whose attributes suggest corridor use behavior

# Usage

```
## S4 method for signature '.MoveTrackSingle'
corridor(x,speedProp=.75, circProp=.25, plot=FALSE, ...)
## S4 method for signature '.MoveTrackStack'
corridor(x,speedProp=.75, circProp=.25, plot=FALSE, ...)
```

# Arguments

X	Move or MoveStack
speedProp	numeric between $0$ and $1$ , defines the proportion of speeds which are high enough to be a valid corridor point
circProp	numeric between $0$ and $1$ , defines the proportion of trajectories that are low enough to be a valid corridor point
plot	logical, if TRUE the track is plotted together with dots that indicate corridor points (color scale indicates how many corridor points are near by, less: blue, many: pink)
	additional arguments like levels and nlevels, see details

### **Details**

The corridor function uses the attributes of a movement step to identify movement steps that exhibit corridor use behavior. For each segment, the speed and the azimuth are calculated and assigned to the segment midpoint. A circular buffer is created around the midpoint of each segment whose radius is equal to half the segment length. The segment azimuth (180 >= azimuth > -180) is then converted into a new unit (the 'pseudo-azimuth' 0 <= 360). Subsequent, the circular variance of the pseudo-azimuths of all segment midpoints that fall within the circular buffer are calculated. This identifies segments that are near parallel segments. Next, it is determined whether a segment's speed

corridor 15

is higher than speedProp (by default the upper 25% speeds) and its circular variance is lower than circProp (by default the lower 25% of all variances). Segment midpoints that meet both of these requirements are considered as a 'corridor' point, all others are considered 'non-corridor' points. Finally, a corridor point is determined to be within a true corridor if within its buffer there are more 'corridor' points than 'non-corridor' points.

### Value

The function returns a MoveBurst object or a list of MoveBurst objects (if a MoveStack is supplied). The MoveBurst dateframe stores the following information:

- segment midpoint
- speed
- azimuth
- pseudo-azimuth
- circular variance

The object is bursted by the factor that indicates whether a coordinate belongs to a corridor segment or not.

#### Note

The default values for the speedProp and circProp can be changed as per the users discretion using the according argument. If the result of the function is assigned to a variable a MoveBurst object is returned (see Value).

16 DBBMM-class

DBBMM-class

The DBBMM class

### **Description**

The DBBMM object is created within the brownian.bridge.dyn function from a Move object. It includes among others a raster object and probabilities.

#### Slots

```
DBMvar Object of class "dBMvarianceTmp": includes the window.size, margin, means, in.windows,
     break.list, and points of interest
crs part of the Raster-class
ext the extension factor set by the user
data part of the Raster-class
extent part of the Raster-class
file part of the Raster-class
history part of the Raster-class
legend part of the Raster-class
method stores the method that was used to calculate the utilization distribution (UD), e.g. dynamic
     Brwonian Bridge
ncols part of the Raster-class
nrows part of the Raster-class
rotated part of the Raster-class
rotation part of the Raster-class
title part of the Raster-class
z part of the Raster-class
```

### Methods

```
contour signature(object = "DBBMM"): adds a contour line to a plot
image signature(object = "DBBMM"): plots the raster from a DBBMM object with fixed cell
    size ratio
plot signature(object = "DBBMM"): plots the raster from a DBBMM object with re-size insensitive proportions
proj4string signature(object = "DBBMM"): extracts the projection method of the raster stored
    within the DBBMM object
raster signature(object = "DBBMM"): extracts the raster from the DBBMM object
outerProbability signature(object = "DBBMM"): calculates the animal occurrence probabilities at the border of the raster
```

### Author(s)

Marco Smolla

DBBMMStack-class 17

DBBMMStack-class

The DBBMMStack class

### **Description**

The DBBMMStack object is created within the brownian.bridge.dyn function from a Move object. It includes among others a raster object and probabilities.

### **Slots**

```
DBMvar Object of class "dBMvariance": includes the break.list and points of interest

crs part of the Raster-class

ext the extension factor set by the user

extent part of the Raster-class

filename part of the Raster-class

rotation part of the Raster-class

title part of the Raster-class

title part of the Raster-class
```

### Methods

### Author(s)

Marco Smolla

18 distance

dBGBvariance-class

Class to store the orthogonal and parallel variance

# **Description**

This class stores the orthogonal and parellel variances calculated with the dynBGBvariance function.

dBMvarianceTmp

dBMvarianceTmp class

# Description

The class dBMvarianceTmp is mostly an internal class that is made public to make inheritance easier. It is a basal class that stores results of the dbbmm

### **Slots**

```
window.size The window size used for dbbmm calculation
margin The margin used for dbbmm calculation
means ...
in.windows ...
interest ...
break.list ...
```

# Author(s)

Marco Smolla

distance

distance information from a track or track stack

# Description

DistanceSummary returns a summary of distance related measurements of a track or track stack, or for the distance function the distance between locations.

dynBGB

### Usage

```
## S4 method for signature '.MoveTrackSingle'
distance(x)
  ## S4 method for signature '.MoveTrackStack'
distance(x)
  ## S4 method for signature '.MoveTrackSingle'
distanceSummary(x)
  ## S4 method for signature '.MoveTrackStack'
distanceSummary(x)
```

### **Arguments**

Χ

Move or MoveStack object

### Value

All values are returned in meters if the projection of the coordinates is longlat, otherwise their in map units mostly meters as well. For longlat distance on a sphere is calculated else on a plane. Check and set the projection of your Move or MoveStack object using the proj4string() function.

### Author(s)

Marco Smolla

### **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))

distance(leroy) #distances from a Move object
distance(stack) #distances from a MoveStack object
distanceSummary(leroy) # summary of distance measures of a Move object
distanceSummary(stack) # summary of distance measures of a MoveStack object</pre>
```

dynBGB

Calculation of the dynamic Bivariate Gausian Bridge

# **Description**

This function creates a utilization distribution according to the Bivariate Gaussian Bridge model. It returns an object of the class dynBGB-class.

20 dynBGB-class

#### **Arguments**

move the move object or variance object used for calculating the ud if a .MoveTrackSingle

object is supplied this is converted into a dBGBvariance object using the dynBGBvariance

function

raster either the raster used for UD calculation or the resolution of the raster used for

UD calculation

locErr the location errors used for the calculation

#### Author(s)

Bart Kranstauber

#### References

Kranstauber, B., Safi, K., Bartumeus, F. (2014), Bivariate Gaussian bridges: directional factorization of diffusion in Brownian bridge models. Movement Ecology 2:5. doi:10.1186/2051-3933-2-5.

### **Examples**

```
data <- move(system.file("extdata","leroy.csv.gz",package="move")) [230:265,]
## change projection method to aeqd and center the coordinate system to the track
dataAeqd <- spTransform(data, CRSobj="+proj=aeqd", center=TRUE)

dBGB <- dynBGB(dataAeqd, locErr=9, raster=10, ext=2.15, windowSize=31, timeStep=6, margin=15)
plot(dBGB, col=hsv(sqrt(1:700/1000)))
lines(dataAeqd)</pre>
```

dynBGB-class dynBGB class

# **Description**

This class stores the utilization density calculated using dynamic Bivariate Gausian Briges. It is an extention of the .UD class.

getMotionVariance(dbbmmstack)
```

getMovebank

Creates an URL to download Data from Movebank

# **Description**

An enhanced function to download data from Movebank by manually building an URL. This function should only be used by advanced programmers.

# Usage

```
getMovebank(entity_type, login, ...)
```

getMovebankAnimals 23

### **Arguments**

entity\_type the entity\_type of the data source

login a MovebankLogin, if empty you'll be asked to enter your username or password

... passing on additional arguments

### Author(s)

Marco Smolla

getMovebankAnimals Animals, tags and IDs in a Movebank study

# Description

Returns the animals, their tags and IDs from a Movebank study

### Usage

```
getMovebankAnimals(study, login)
```

# **Arguments**

study a character string (study name) or the numeric study ID as it is stored on Move-

bank

login an object of the MovebankLogin-class, if empty you'll be asked to enter your

username or password

### Details

getMovebankAnimals belongs to the Movebank browsing functions and returns a data.frame that includes the animalID, animalName, id, sensor\_type\_id and tag\_id from the requested study.

# Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

### Author(s)

Marco Smolla

```
## Not run:
getMovebankAnimals(study=82207, login=login)
## End(Not run)
```

24 getMovebankData

getMovebankData Download data from Movebank
---

### **Description**

getMovebankData downloads the location and timestamp columns of a study stored in Movebank

# Usage

```
getMovebankData(study, animalName, login, ...)
```

### **Arguments**

study character, full name of the study, as stored on Movebank

animalName character, single or a vector, with the name of the individuals as stored on Move-

bank

login a MovebankLogin, if empty you'll be asked to enter your username or password

... passing on additional arguments

### **Details**

getMovebankData belongs to the Movebank browsing functions and returns a Move object from studies with only on animal or MoveStack object for studies with multiple animals. If only a single or several particular animals of a study should be downloaded, a character vector can be provided for the animalName argument.

Remember that you need an account at Movebank.org, see movebankLogin.

#### Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

It his possible to add the argument removeDuplictedTimestamps and set it to true which allows you delete the duplicated timestamps, it is strongly advised not to use this option because there is no control over which records are removed. Its better to edit the records in movebank.

### Author(s)

```

getMovebankID 25

```
#returns a MoveStack with two individuals
## End(Not run)
```

getMovebankID

Study ID

# **Description**

Returns the numeric study ID that corresponds to the character study NAME stored on Movebank

# Usage

```
getMovebankID(study,login)
```

# **Arguments**

study character, full name of the study, as stored on Movebank

login an object of the MovebankLogin-class, if empty you'll be asked to enter your

username or password

### **Details**

getMovebankID belongs to the Movebank browsing functions and returns the ID of a study as it is stored on Movebank.org.

### Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

## Author(s)

Marco Smolla

```
## Not run:
getMovebankID(study="BCI Ocelot", login=login)
## End(Not run)
```

26 getMovebankSensors

getMovebankSensors

Information about Movebank sensors

# **Description**

getMovebankSensors returns information about sensors in a study.

# Usage

```
getMovebankSensors(study, login)
```

# **Arguments**

study a character string (study name) or the numeric study ID as it is stored on Move-

bank

login an object of the MovebankLogin-class, if empty you'll be asked to enter your

username or password

### **Details**

getMovebankSensors belongs to the Movebank browsing functions and returns either information about all sensor types that are available on Movebank (if the study argument is missing) or the sensor IDs corresponding to to the animal IDs in a specific study.

### Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

# Author(s)

Marco Smolla

```
## Not run:
getMovebankSensors(study=123413, login=login)
## End(Not run)
```

getMovebankSensorsAttributes

Available sensor attributes

# Description

This function returns all attributes of the sensors of the requested study.

## Usage

```
getMovebankSensorsAttributes(study, login)
```

# **Arguments**

study a character string (study name) or the numeric study ID as it is stored on Move-

bank

login an object of the MovebankLogin-class, if empty you'll be asked to enter your

username or password

### **Details**

getMovebankSensorAttributes belongs to the Movebank browsing functions and returns the attributes of the sensors of a study, i.e. what is the sensor id and which data types are stored for this sensor (e.g. GPS sensors store longitude and latitude locations, and timestamps and have 673 as their ID on Movebank).

#### Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

# Author(s)

Marco Smolla

```
## Not run:
getMovebankSensorsAttributes(study=123413, login=login)
## End(Not run)
```

28 getMovebankStudies

getMovebankStudies

All studies on Movebank

# Description

Returns all studies available on Movebank

# Usage

```
getMovebankStudies(login)
```

### **Arguments**

login

an object of the MovebankLogin-class, if empty you'll be asked to enter your username or password

# Details

getMovebankStudies belongs to the Movebank browsing functions and returns a data.frame of all studies available on Movebank.

### Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

# Author(s)

Marco Smolla

```
## Not run:
getMovebankStudies(login=login)
## End(Not run)
```

getMovebankStudy 29

getMovebankStudy	Returns study information
gc ti lo v cbariles tady	Returns sindy injormation

### **Description**

getMovebankStudy belongs to the Movebank browsing functions and returns information about the requested study like the authors of that study, licence type, citation and more.

# Usage

```
getMovebankStudy(study, login)
```

# Arguments

study a character string (study name) or the numeric study ID as it is stored on Move-

bank

login an object of the MovebankLogin-class, if empty you'll be asked to enter your

username or password

#### Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

### Author(s)

Marco Smolla

# **Examples**

```
## Not run:
getMovebankStudy(study="BCI Agouti", login=login)
## End(Not run)
```

getVolumeUD

Modify a UD raster

# **Description**

Modifies the UD raster: that the cell values of the resulting raster are equal to the percentage of the smallest home range containing this cell.

# Usage

```
## S4 method for signature '.UD' getVolumeUD(x, ...)
```

30 hrBootstrap

# **Arguments**

x one or several objects of the DBBMM-class or an DBBMMStack-class object

additional Raster or DBBMM objects

### Author(s)

Marco Smolla

#### See Also

raster2contour

### **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
getVolumeUD(leroydbbmm) #for a single object
getVolumeUD(dbbmmstack)
getVolumeUD(leroydbbmm, leroydbbmm) #for several objects
plot(getVolumeUD(leroydbbmm))
```

hrBootstrap

Calculates and plot the Minimum Convex Polygon for a track

# Description

The hrBootstrap function calculates the 0, 25, 50, 75, 100% percentile of the Minimum Convex Polygon area by step wise (logarithmic) increasing the number of samples per calculation. For every step this calculation is repeated rep times with random coordinates from the track. For example it calculates 100 times the mcp area from 3 random locations and store the area. In the next step it calculates it from 5 random locations and so on. The returned graph shows the 5 percentiles of the area sizes. The dashed line indicates the real mcp area size of all locations.

# Usage

```
## S4 method for signature 'SpatialPoints'
hrBootstrap(x, rep=100, plot=TRUE, level=95, levelMax=100, unin='km', unout='m2', ...)
## S4 method for signature '.MoveTrackStack'
hrBootstrap(x, rep=100, plot=TRUE, level=95, levelMax=100, unin="km", unout="m2", ...)
```

hrBootstrap 31

# **Arguments**

х	Move, MoveStack, or SpatialPoints object
rep	numeric value for the number of repetitions per sample size, default is 100
plot	logical value that indicates whether the graph is plotted or not, default is TRUE
level	the percentage of coordinates taken into account for the MCP area size calculation, default is 95 (95% of all coordinates are taken into account)
levelMax	the percentage of coordinates taken into account for the maximum MCP area size calculation (horizontal line in the plot)
unin	units form the input values (can be 'm' or 'km')
unout	units for the output values (can be 'm2', 'km2', or 'ha')
	a Move or MoveStack object

### **Details**

The hrBootstrap function passes values (samples of the track) on to the function mcp that is part of the adehbitatHR package. See the help function of mcp for more information about input and output units.

### Value

The values are returned in a data.frame with the units indicated by unout.

# Note

Plots for MoveStacks are plotted one after another, and not side by side.

### Author(s)

Marco Smolla

```
m <- move(x=rnorm(70), y=rnorm(70), time=as.POSIXct(1:70, origin="1970-1-1"),
    proj=CRS("+proj=aeqd"))
hrBootstrap(m,rep=5, level=99, unout="m2", plot=TRUE) #for a Move object

mstack <- moveStack(list(m,m))
hrBootstrap(mstack,rep=5, unout="m2", plot=FALSE) #for a MoveStack object

hrBootstrap(as(m, "SpatialPoints"),rep=5, unout="m2", plot=TRUE) #for a SpatialPoints object</pre>
```

32 idData

idData

Functions for dealing with the idData

# **Description**

This function returns or replaces the idData which is the data per individual.

# Usage

```
## S4 replacement method for signature '.MoveTrack,missing,missing,data.frame'
idData(x,i,j) <- value
  ## S4 replacement method for signature '.MoveTrack,ANY,ANY,ANY'
idData(x,i,j) <- value
  ## S4 method for signature '.MoveTrack'
idData(x,i,j,...)</pre>
```

# Arguments

X	Move, MoveBurst or MoveStack object
i	Selection of the rows
j	Selection for the columns
value	Replacement values for the selected idData
	Other arguments to the data frame subseting such as drop=F

# Value

Either the idData data frame or the modified move object

# Author(s)

Bart Kranstauber

```
\label{load} load(system.file("extdata", "move.RData", package="move"), . GlobalEnv) \\ idData(leroy)
```

interpolateTime 33

interpolateTime	Interpolate a trajectory	

### Description

This function allows to interpolate trajectories. It does this on the basis of a simple interpolation, depending on the spaceMethod that is specified.

### Usage

```
interpolateTime(x, time, spaceMethod=c('euclidean','greatcircle','rhumbline'),...)
```

### **Arguments**

an object of the Move-class
 either timestamps, or a number of locations or time interval that is used to gen-

erate a sequence of timestamps using the seq function a character that indicates the interpolation function to be used

... other arguments currently not used

### Author(s)

Bart Kranstauber

spaceMethod

### **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
plot(interpolateTime(ricky[1:200,], 700, 'gr'))
```

leroy

GPS track data from a fisher

### **Description**

This file includes spatial data from a fisher (*Martes pennanti*). It can be used to test the different functions from the move package.

These location data were collected via a 105g GPS tracking collar (manufactured by E-obs GmbH) and programmed to record the animal's location every 15 minutes, continuously. The collar was deployed from 10 February 2009 through 04 March 2009 on an adult, resident, male fisher, in New York, USA (see References). The data usage is permitted for exploratory purposes. For other purposes please get in contact.

### Author(s)

# **Examples**

```
## create a Move object from the data set
data <- move(system.file("extdata","leroy.csv.gz",package="move"))
plot(data)</pre>
```

lines

Plotting a track as lines

# **Description**

Function for plotting a recorded track from a Move object as lines

# Usage

```
## S4 method for signature '.MoveTrackSingle'
lines(x,...)
## S4 method for signature '.MoveTrackStack'
lines(x,col=NA,...)
## S4 method for signature '.MoveTrackSingleBurst'
lines(x,col=NA,...)
```

# **Arguments**

```
    x Move object
    col a vector of colors (same length as the number of objects)
    ... arguments to be passed on, e.g. col for color, or add to add the lines to a plot.
```

# Author(s)

Marco Smolla

### See Also

```
points plot
```

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
plot(leroydbbmm)
lines(spTransform(leroy, center=TRUE), col=3) # add a track from a Move object to a plot
```

move 35

move

Create a Move object

### **Description**

The move method creates Move or MoveStack object from Movebank or other (compressed) csv files, also zip files from the environmental annotation tool can be loaded. If you use your own data you need to set the projection method with the 'proj' argument and specify in which column of your data the function finds locations and timestamps.

### Usage

```
## S4 method for signature 'connection,missing,missing,missing,missing'
move(x, removeDuplicatedTimestamps=F, ...)
## S4 method for signature 'numeric,numeric,POSIXct,data.frame,ANY'
move(x, y, time, data, proj, sensor='unknown',animal='unnamed',...)
```

### **Arguments**

x	Full path to the file location, OR a vector with x coordinates if non-Movebank data are provided (e.g. data\$x)
у	vector of y coordinates if non-Movebank data are provided
time	column indicator for non-Movebank data for the time stamps, with POSIXct conversion, i.e. as.POSIXct(data\$timestamp, format="%Y-%m-%d %H:%M:%S", tz="UTC")
data	Optional extra data associated with the relocation, if empty it is filled with the coordinates and timestamps
proj	projection method for non-Movebank data; requires a valid CRS (see CRS-class) object, like CRS("+proj=longlat +ellps=WGS84"); default is NA
sensor	sensor name, either single character or a vector with length of the number of coordinates
animal	animal ID or name, either single character or a vector with length of the number of coordinates
removeDuplicatedTimestamps	
	It his possible to add the argument removeDuplicatedTimestamps and set it to true which allows you delete the duplicated timestamps, it is strongly advised not to use this option because there is no control over which records are removed. Its better to edit the records in movebank.
	Additional arguments

### **Details**

The easiest way to import data is to download the study you are interested in from www.movebank. org. Set the file path as the x argument of the move function. The function detects whether there are single or multiple individuals in this file and automatically creates either a Move or MoveStack object. Another way is to read in your data using read.csv. Then the columns with the x and y coordinates, and the timestamp, as well as the whole data.frame of the imported data are given to the move function. Again the function detects whether to return a Move or a MoveStack object

36 Move-class

#### Note

The imported data set is checked whether it is in a Movebank format. If this is not the case, you have to use the alternative import for non-Movebank data (see above). Because the SpatialPoints-DataFrame function that creates the spatial data frame (sdf) of the Move object can not process NA location values, all rows with NA locations are omitted. A list of the omitted timestamps is stored in the timesMissedFixes slot of the Move object.

If the data include double timestamps check your data for validity. You may want to consider a function to delete double timestamps, like:

```
data <- data[which(!duplicated(data$timestamp)), ]</pre>
```

Due to convention all names are turned into 'good names' which means, without spaces ('Ricky T' becomes 'Ricky.T').

### Author(s)

Marco Smolla

### **Examples**

```
## create a move object from a Movebank csv file
filePath<-system.file("extdata","leroy.csv.gz",package="move")
data <- move(filePath)

## create a move object from non-Movebank data
file <- read.table(filePath,
    header=TRUE, sep=",", dec=".")
data <- move(x=file$location.long, y=file$location.lat,
    time=as.POSIXct(file$timestamp,
    format="%Y-%m-%d %H:%M:%S", tz="UTC"),
    data=file, proj=CRS("+proj=longlat"), animal="Leroy")</pre>
```

Move-class

The Move class

# Description

The Move object contains at least time and coordinate information of an animal. It can contain further data that are individual to the animal, e.g. the sex or age. These data are stored in the idData data.frame. If the object was created with the Movebank browsing functions it does also contain the study name, licence and citation information.

#### Slots

```
idData Object of class "data.frame": additional (one row) data;
dateCreation Object of class "numeric": time stamp when the file was downloaded;
study Object of class "character": name of the study;
citation Object of class "character": how to cite the study;
```

Move-class 37

license Object of class "character": the license under which the data were published;

**timesMissedFixes** Object of class "POSIXct": stores the timestamps of lines of the data set that were removed because they included NA locations

bbox belongs to the SpatialPointsDataFrame

coords coordinates of the track, belongs to the SpatialPointsDataFrame

coords.nrs belongs to the SpatialPointsDataFrame

data additional data of that object that is stored in the SpatialPointsDataFrame

**proj4string** projection of the coordinates

timestamps timestamps according to the coordinates

#### Methods

```
move signature(object = "Move"): creates a Move object
getMovebankData signature(object = "character"): creates a Move object by accessing
    Movebank

spTransform signature(object = "Move"): transforms coordinates to a different projection
    method

show signature(object = "Move"): prints a summary of all data stored in the Move object
as.data.frame signature(object = "Move"): extracts the spatial data frame
coordinates signature(object = "Move"): extracts the coordinates only from the Move object
proj4string signature(object = "Move"): extracts the projection method from the Move object
time.lag signature(object = "Move"): calculates time lags between coordinates
n.locs signature(object = "Move"): calculates number of locations
plot signature(object = "Move"): plots the track of the animal
```

## Note

.MoveTrack and .MoveTrackSingle are also exported for other people to program against

## Author(s)

Marco Smolla

38 move2ade

move2ade

Convert a Move or MoveStack object to adehabitat compatible object

## **Description**

Convert a Move or MoveStack object to adehabitat compatible object. This is necessary because Move and MoveStack objects are not inherited by the object class that is typically used by the adehabitat package. Therefore, the move2ade function allows to use functions of the adehabitatHR package with objects that were originally created with the Move package.

#### Usage

```
## S4 method for signature '.MoveTrackSingle'
move2ade(x)
  ## S4 method for signature '.MoveTrackStack'
move2ade(x)
```

## **Arguments**

Х

a Move or MoveStack object

## Value

The returned object is from SpatialPointsDataFrame with the animal name (or 'unnamed') stored in the data slot of the SpatialPointsDataFrame.

# Author(s)

Marco Smolla

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))
move2ade(ricky) #for a Move object
move2ade(stack) #for a MoveStack object</pre>
```

movebankLogin 39

movebankLogi	า
mo v courniceog in	

Login into Movebank

# Description

Creates an object that can be used with all Movebank browsing functions.

# Usage

```
## S4 method for signature 'character,character'
movebankLogin(username,password)
```

# Arguments

username Your Movebank username
password Your Movebank password

#### **Details**

Use this function to login to Movebank. After you logged in, you can use the Movebank browsing functions from the move package.

#### Note

If you do not have the RCurl package installed movebankLogin will store your username and password in the object you assign it to. Furthermore, if you have no RCurl a http connection is used to retrieve data from Movebank instead of the more secure https protocol.

# Author(s)

Marco Smolla

```
## Not run:
##first create the login object
login <- movebankLogin{username="xxx", password="zzz"}
##and than use it with Movebank browsing functions
getMovebankStudies(login)
## End(Not run)</pre>
```

40 MoveBurst

MovebankLogin-class

The MovebankLogin class

## Description

The MovebankLogin object is needed for every Movebank browsing function. Alternatively, one can also chose to enter the username and password every time one uses one of the browsing functions.

## **Slots**

```
username username as characterpassword password as characterrcurl logical value, whether RCurl is installed or not
```

#### Methods

```
movebankLogin signature(object = "character"): creates a MovebankLogin object
```

#### Author(s)

Marco Smolla

MoveBurst

MoveBurst class

# **Description**

The class MoveBurst, used for storing information about one individual with assignments of segments. Every segment between to locations has a class for example behavioural category.

#### **Slots**

```
bbox ...
burstId ...
citation ...
coords ...
coords.nrs ...
data ...
dateCreation ...
idData ...
license ...
```

moveStack 41

```
proj4string ...
sensor ...
study ...
timesMissedFixes ...
timestamps ...
```

## Author(s)

Marco Smolla

moveStack

Creating a MoveStack

## **Description**

Stacks a list of Move objects

## Usage

```
## S4 method for signature 'list'
moveStack(x)
```

## Arguments

Х

a list of Move objects

## **Details**

This function stacks single Move objects to a MoveStack object.

## Note

All animal names are converted into 'good names' which means, that spaces are replaced with points and duplicated names get an individual number added. For example:

```
'Leroy, Leroy' -> adding number to duplicated names ->'Leroy, Leroy.1'
```

#### Author(s)

Marco Smolla

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)

1 <- list(ricky[200:270,], leroy[200:270,])
moveStack(1)</pre>
```

<sup>&#</sup>x27;Ricky T' -> replacing spaces -> 'Ricky.T'

42 MoveStack-class

MoveStack-class

The MoveStack class

## **Description**

The MoveStack object is created within the brownian.bridge.dyn function from a Move object. It includes among others a raster object and probabilities.

#### **Slots**

citation Object of class "dBMvariance": includes the break.list and points of interest, ...;

bbox belongs to the SpatialPointsDataFrame

coords the extension factor set by the user

coords.nrs belongs to the SpatialPointsDataFrame

data additional data of that object that is stored in the SpatialPointsDataFrame

dateCreation date and timestamp when this object was created

idData additional data to all individuals

license the license terms of the used track material

proj4string projection of all coordinates

study name of the study

timestamps timestamps according to the coordinates

trackId a vector that indicates, which data, coordinates and timestamps belong to an individual

# Methods

Methods defined with class "MoveStack" in the signature:

```
[ signature(x="MoveStack"): select subset ...
```

getMovebankData signature(object = "character"): creates a MoveStack object by accessing Movebank

## Author(s)

Marco Smolla

n.locs 43

n.locs

Extract the number of locations of a Move or MoveStack object

## **Description**

The n.locs method returns the number of locations of a track from a Move or MovesStack object.

# Usage

```
## S4 method for signature 'SpatialPointsDataFrame'
n.locs(obj)
  ## S4 method for signature '.MoveTrackStack'
n.locs(obj)
```

#### Arguments

obj

Move or MoveStack object

#### Author(s)

Marco Smolla

## **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))

n.locs(ricky) #number of locations of Move object
n.locs(stack) #number of locations of MoveStack object</pre>
```

outerProbability

Calculates the probabilities at the edges of a raster

# Description

The outerProbability method calculates the summed probability of the cells at the border of a raster

## Usage

```
## S4 method for signature 'RasterLayer'
outerProbability(raster,border,...)
## S4 method for signature 'DBBMMStack'
outerProbability(raster,border,...)
```

44 plot

## **Arguments**

raster a RasterLayer or DBBMMStack object that has values for the raster cells border numeric from 0 to 1; ratio of the number of columns at the border relative to the whole raster from which the probabilities should be summed up; default is 10% (0.1)

hand over information

#### **Details**

The function returns the summed probability at the border (e.g. the outer 10% of the cells) of a raster. This value can be used as an indicator whether the extent of the used raster is to small for the UD calculation and therefore too much probabilities are not calculated because they are outside the raster.

#### Value

numeric value for a single DBBMM object, or a list of numeric values for a DBBMMStack

#### Author(s)

Marco Smolla

## **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
#calculate the probabilities of 20% of the raster at the border from a DBBMM
outerProbability(leroydbbmm, border=.2)
#calculate the probabilities of 50% of the raster at the border from a DBBMMStack
outerProbability(leroydbbmm, border=.5)
```

plot

Plotting track or raster

# **Description**

Function for plotting a recorded track from a Move object or the probability values from a DBBMM object

#### Usage

```
## S4 method for signature '.MoveTrackSingle,missing'
plot(x, y, asp=1, ...)
## S4 method for signature '.MoveTrackStack,missing'
plot(x, y, type="p", asp=1, ...)
## S4 method for signature '.MoveTrackSingleBurst,missing'
plot(x, y, type="p", asp=1, ...)
```

plot 45

# Arguments

X	Move, MoveStack, MoveBurst or DBBMM object
у	unused variable (listed for compatibility reasons)
type	defines the type of the plot (e.g. 'l', 'p', 'b', 'o')
asp	defines the aspect ratio of the plot generally 1 makes most / only sense since then $\boldsymbol{x}$ and $\boldsymbol{y}$ dimenstions are the same
• • •	arguments to be passed to methods, such as graphical parameters, and the logical add argument (see par)

#### **Details**

If x is a Move, MoveStack object a track is plotted with points and lines. The track can be added to another plot with the add = TRUE.

If x is a MoveBurst object colored lines (according to the burstID) are plotted if the type is set to 'l'. By default it is 'p' which plots the real coordinates of the Move object as points. If x is a DBBMM object its raster object is plotted with the corresponding cell values. Unlike the image function, the cell size ratio keeps the same when the plot window is re-sized.

#### Note

Have a look on the proportion of the graphic device when printing a track or raster. The plot function does not use equal sized units on both axes.

plot(leroy, type="o", col=3)
plot(stack, col=c(3,5), lwd=3) # plot a MoveStack object
plot(stack, type="l", col=c(3,5), lwd=3)

plot(leroydbbmm) # plot the raster of a DBBMM object
plot(dbbmmstack) # plot the raster of a DBBMMStack object</pre>
```

46 plotBursts

plotBursts

Plotting the centroids of a track

## **Description**

The plotBursts function plots bursted Move objects (see ?burst for how to create a bursted Move Object). For every single burst a circle is plotted at the center of every segment of a track. A segment represents consecutive coordinates that belong to a single burst. The properties of the plotted circles (size and color) can represent different information (see Details).

## Usage

#### **Arguments**

object	a SpatialPointsDataFrame or a list of these that include coordinates and color, and size of the centroid indicators
add	logical, if FALSE a new plot is generated, default is TRUE
sizeFUN	a function to calculate the size of the plotted circles (see details)
breaks	how many size classes should the circles have, default is 3
col	a vector of color codes with the same length as the burstID. By default the standard colors from 1:8 are used. If there are more than 8 burstIDs the colors are recycled
	additional plot attributes

# **Details**

Circle colors correspond to burstIDs. The size of the circles is defined by a function. By default this function calculates the relative duration of a segment compared to the whole duration. The function can be adjusted to use a different measure using the sizeFUN argument.

Note, it is possible to define break points by using the breaks argument.

#### Author(s)

Marco Smolla

points 47

#### **Examples**

```
test <- move(system.file("extdata","leroy.csv.gz", package="move"))
behav <- c(rep(1:4,each=200), rep(5, 118))
testb <- burst(test, f=behav)
plot(coordinates(test),type="1")
plotBursts(testb, breaks=3, add=TRUE, pch=19)
plotBursts(testb, breaks=5, add=FALSE, pch=19)
##plotBursts(leroy_b, breaks=c(-Inf,4000,6000, Inf), add=FALSE, pch=19)
#bursting track by realtive segment length
plotBursts(object=testb, breaks=3, sizeFUN=function(x) sum(seglength(x)), pch=19, add=FALSE)</pre>
```

points

Plotting the points of a track

# Description

Function for plotting a recorded track from a Move object as points.

## Usage

```
## $4 method for signature '.MoveTrackSingle'
points(x,...)
## $4 method for signature '.MoveTrackStack'
points(x,col=NA,...)
## $4 method for signature '.MoveTrackSingleBurst'
points(x,...)
```

#### **Arguments**

```
    x Move or a DBBMM object
    col a vector of colors (same length as the number of objects)
    ... arguments to be passed on, e.g. col for color, or add to add the points to a plot.
```

#### **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
plot(leroydbbmm)
points(spTransform(leroy, center=TRUE), col=3) # add a track from a Move object to a plot
```

raster

Extract raster from DBBMM

## **Description**

Extracts the RasterLayer from a DBBMM and DBBMMStack object.

# Usage

```
## S4 method for signature 'DBBMM'
raster(x)
  ## S4 method for signature 'DBBMMStack'
raster(x)
```

#### **Arguments**

Χ

a DBBMM or DBBMMStack object

## **Details**

The raster function extracts the raster object from a DBBMM or DBBMMStack object.

# Value

An object from class RasterLayer is returned.

#### Author(s)

Marco Smolla

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)

raster(leroydbbmm) #returns the raster of a DBBMM object
raster(dbbmmstack) # returns the raster of a DBBMMStack object

plot(raster2contour(leroydbbmm, levels=c(.5,.9)), col=c(5,4)) # plot the raster lines of a DBBMM
```

raster2contour 49

raster2contour

Convert raster to contour lines

#### **Description**

The function converts a ud(stack) object to a SpatialLinesDataFrame.

## Usage

```
## $4 method for signature '.UD'
raster2contour(x, ...)
## $4 method for signature '.UDStack'
raster2contour(x, ...)
```

# Arguments

x a DBBMM or DBBMMStack object, that includes a raster object

additional arguments that are passed on from other functions, most important being level which determines the contour level

#### **Details**

The raster2contour function creates a SpatialLinesDataFrame from a given raster or DBBMM object. This allows to re-project the contours to different projections.

## Author(s)

Marco Smolla

#### See Also

```
getVolumeUD
```

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
raster2contour(leroydbbmm)
raster2contour(dbbmmstack)
raster2contour(dbbmmstack, level=c(.5,.95))
```

50 searchMovebankStudies

ricky

GPS track data from a fisher

## **Description**

This file includes spatial data from a fisher (*Martes pennanti*). It can be used to test the different functions from the move package.

These location data were collected via a GPS tracking collar (manufactured by E-obs GmbH) and programmed to record locations depending on the animal's behaviour (up to a one location every two minutes). The collar was deployed on an adult, resident, male fisher, in New York, USA (see References). The data usage is permitted for exploratory purposes. For other purposes please get in contact.

#### Author(s)

Scott LaPoint

#### References

For more information, contact Scott LaPoint <sdlapoint@gmail.com>

## **Examples**

```
## create a Move object from the data set
data <- move(system.file("extdata","ricky.csv.gz",package="move"))
plot(data)</pre>
```

searchMovebankStudies Search for a study

# Description

Searches for a study within Movebank

## Usage

```
searchMovebankStudies(x, login)
```

#### **Arguments**

x a character string to search within the Movebank study names

login an object of the MovebankLogin-class, if empty you'll be asked to enter your

username or password

seglength 51

## **Details**

The search function searches explicitly for the entered phrase. If you for example type 'Goose' it will not show you studies including 'goose'. So rather search for 'oose' to find both.

#### Value

The function returns a character vector of study names.

#### Note

See the 'browseMovebank' vignette (move website download section) for more information about security and how to use Movebank from within R.

## Author(s)

Marco Smolla

## **Examples**

```
## Not run:
searchMovebankStudies("MPIO", login=login) #returns all studies that include this exact term
## End(Not run)
```

seglength

Calculates the segment length of a track

# Description

Calculates the segment length of a track

## Usage

```
## S4 method for signature 'SpatialPointsDataFrame'
seglength(x)
```

# **Arguments**

Χ

a SpatialPointsDataFrame, like a Move or MoveStack object

#### **Details**

The seglength function calculates the distances between point 1 and point 2, point 2 and point 3, ...

٠

52 show

## Value

If the SpatialPointsDataFrame is projected in longitude latitude coordinates, the returned values are in meters. If not, the distances are calculated with the Pythagoras' theorem and the distances are Euclidean distances in map units.

#### Author(s)

Marco Smolla

## **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))
head(seglength(leroy)) #Move object in longlat projection
head(seglength(stack)) #MoveStack object in aeqd projection</pre>
```

show

Show a Move object

#### **Description**

Displays a summary of a Move object.

# Usage

```
## S4 method for signature 'Move'
show(object)
## S4 method for signature 'MoveStack'
show(object)
```

# Arguments

object

a Move or MoveStack object

#### **Details**

The show function displays a summary of a Move object. This includes:

- animal ID
- species name
- · study name
- number of track points
- receiver type
- · projection method
- date of file creation

speed 53

- the first three lines of the spatial data frame
- study citation
- · data license
- number of omitted locations due to NAs in the dataset

If the imported data are not from the Movebank database Animal, Species, nPoints, Receiver, and Study are not shown.

#### Author(s)

Marco Smolla

speed

speed information from a track or track stack

# **Description**

This function returns a summary of speed related measurements of a Move or MoveStack object.

# Usage

```
## S4 method for signature '.MoveTrackSingle'
speed(x)
  ## S4 method for signature '.MoveTrackStack'
speed(x)
  ## S4 method for signature '.MoveTrackSingle'
speedSummary(x)
  ## S4 method for signature '.MoveTrackStack'
speedSummary(x)
```

#### **Arguments**

Χ

Move or MoveStack object

# Value

The function returns the speed in m/s if the track is longlat else map units per second. In most cases the map units will also be meters.

#### Author(s)

Marco Smolla

54 split

## **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))

speed(ricky) #speeds from a Move object
speed(stack) #speeds from a MoveStack object
speedSummary(leroy) # summary of speed measures of a Move object
speedSummary(stack) # summary of speed measures of a MoveStack object</pre>
```

split

Splitting a MoveStack

# Description

Splitting MoveStack in a list of Move objects

## Usage

```
## S4 method for signature 'MoveStack,missing'
split(x, f, drop=FALSE, ...)
```

# Arguments

X	MoveStack or MoveBurst object
f	not needed
drop	not needed
	not needed

#### **Details**

A MoveStack is split into a list of Move objects by the track IDs of the given MoveStack. For stacking moveStack can be used. Also a MoveBurst object can be split this will lead to seperate list elements for every burst, every location where the burst is switched will then be recycled.

#### Author(s)

Marco Smolla

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
movestack <- moveStack(list(leroy,ricky))

split(movestack) #splitting a MoveStack
split(dbbmmstack) #splitting a DBBMMStack</pre>
```

spTransform 55

spTransform	Transform Move object projection method	

#### **Description**

The spTransform function transforms the coordinates stored in the Move object from the default longlat coordinates to the default aeqd (Azimuthal Equi-distance) projection or a different projection.

## Usage

```
## S4 method for signature 'Move, character'
spTransform(x,CRSobj, center=FALSE)
## S4 method for signature 'Move, missing'
spTransform(x, center=FALSE,...)
```

## **Arguments**

X	a Move or a MoveStack object
CRSobj	a CRS like character that describes the projection method to which the coordinates should be transformed, if missing "+proj=aequd" is used as default value
center	logical, if TRUE the center of the coordinate system is the center of the track; FALSE is default
	for additional arguments

#### **Details**

The spTransform function transforms the coordinates of a Move object by default from "+proj=longlat" to "+proj=aeqd". In this format the coordinates can be used by the brownian.bridge.dyn function.

If center is TRUE the center of the coordinate system is set to the center of the track.

#### Author(s)

Marco Smolla

```
## create a Move object
leroy <- move(system.file("extdata","leroy.csv.gz",package="move"))
## transform the Move object by default into "+aeqd" projection method
## and center the coordinate system
spTransform(leroy, center=TRUE)
## transform the Move object into another projection method, like mollweide
spTransform(leroy, CRSobj="+proj=moll")</pre>
```

56 subset-method

```
##check projection method
proj4string(leroy)
```

subset-method

Returns a single object from a MoveStack

# Description

The subset function can be used to return a subset of a Move(Stack) object.

# Usage

```
## S4 method for signature 'MoveStack, ANY, ANY'
x[i]
  ## S4 method for signature 'MoveStack, character, missing'
x[[i]]
```

## **Arguments**

x MoveStack object

i numeric, character or logical vector for individuals in a stack or a set of locations

#### **Details**

The double square bracket method is used for sub setting a stack to a single move object according to the individual name or return a stack of multiple individuals.

## Author(s)

Bart Kranstauber

```
load(system.file("extdata", "move.RData", package="move"))
st <- moveStack(list(leroy[50:100,],ricky=ricky[90:170,]))
st[1]
st[['ricky']]
st[[2]]
st[[c(TRUE,FALSE)]]</pre>
```

summary 57

summary

A summary of a DBBMM or DBBMMStack, Move or MoveStack object

## **Description**

Summarizes the information of the raster from a DBBMM or DBBMMStack, or the data from a Move or MoveStack object

# Usage

```
## S4 method for signature '.UD'
summary(object)
  ## S4 method for signature '.UDStack'
summary(object)
  ## S4 method for signature '.MoveTrackSingle'
summary(object)
  ## S4 method for signature '.MoveTrackStack'
summary(object)
```

#### **Arguments**

object

a DBBMM/DBBMMStack, Move/MoveStack object

#### **Details**

Returns the projection, extent, and maximum and minimum values of the raster stored within the DBBMM or DBBMMStack object. If the object is a Move or MoveStack object the functions distance, time, speed, and angle is called and a list with the summarized values is returned.

## Author(s)

Marco Smolla

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))

summary(leroy) # summary of angle measures of a Move object
summary(stack) # summary of angle measures of a MoveStack object
summary(leroydbbmm) # summary of a DBBMM object
summary(dbbmmstack) # summary of a DBBMMStack object</pre>
```

58 time.lag

time.lag

Calculates the time lags between the coordinates

# **Description**

The time.lag function calculates the time lags between locations.

#### Usage

```
## S4 method for signature '.MoveTrackSingle'
time.lag(x,...)
  ## S4 method for signature '.MoveTrackStack'
time.lag(x,units, ...)
```

# Arguments

x a Move or MoveStack object
 units The units used for the conversion, they need to be specified for a stack to ensure similair units between individuals
 further arguments

#### **Details**

Optionally the argument units can be passed on to ensure the time lag in a certain unit, this is especially useful in case a move stack is bursted. For more information on the units argument see the help of difftime.

#### Value

The function returns a numeric vector with the time lags.

#### Author(s)

Marco Smolla

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))
head(time.lag(leroy)) #calculate timelags for a Move object
head(time.lag(stack)) #calculate timelags for a MoveStack object
head(time.lag(stack, units="hours")) #calculate timelags in different units</pre>
```

timestamps 59

timestamps

Extract the timestamps of a Move or MoveStack object

#### **Description**

The timestamps method returns or sets the timestamps of a track from a Move or MovesStack object.

## Usage

```
## S4 method for signature '.MoveTrackSingle'
timestamps(this)
## S4 method for signature '.MoveTrack'
timestamps(this)
## S4 replacement method for signature '.MoveTrack'
timestamps(this) <- value</pre>
```

#### **Arguments**

this Move or MoveStack object value timestamps from class POSIXct

## Author(s)

Marco Smolla

## **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))

timestamps(leroy) #get the timestamps from a Move object
timestamps(stack) #get the timestamps from a MoveStack object
timestamps(leroy) <- timestamps(leroy)+60 #change the timestamps and set it for a Move object
timestamps(stack) <- timestamps(stack)+60 #change the timestamps and set it for a MoveStack object</pre>
```

timeSummary

time information from a track or track stack

## **Description**

This function returns a summary about time related measurements of a Move or MoveStack object.

60 trackId

#### Usage

```
## S4 method for signature '.MoveTrackSingle'
timeSummary(x, units="hours")
  ## S4 method for signature '.MoveTrackStack'
timeSummary(x, units="hours")
```

## **Arguments**

x Move or MoveStack object
units defines the output uni, 'secs', 'mins', 'hours', 'days', ...

#### Author(s)

Marco Smolla

## **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))

time.lag(leroy)
time.lag(stack)
timeSummary(ricky) # summary of time measures of a Move object
timeSummary(stack, units="hours") # summary of time measures of a MoveStack object</pre>
```

trackId

Returns trackId

#### **Description**

Obtain a factor returning the ids of individuals per location

## Usage

```
## S4 method for signature 'MoveStack'
trackId(x)
```

#### **Arguments**

Х

a MoveStack object

#### Value

Returns a factor indicating to which individuals locations belong in a stack.

## Author(s)

Bart Kranstauber

turnAngleGc 61

## **Examples**

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
stack <- moveStack(list(leroy,leroy))
trackId(stack)</pre>
```

turnAngleGc

Calculates turning angles on great circle tracks

# Description

This function returns the turn angels of a great circle track.

## Usage

```
## S4 method for signature '.MoveTrackSingle'
turnAngleGc(x)
```

## **Arguments**

Х

Move object, in long lat projection

#### **Details**

On great circle tracks the bearing of arrival on a point is not the same as witch the previous point was left. This function returns the difference between these bearings between -180 and 180. The bearings are calculated using the functions bearing and finalBearing of the geosphere package.

#### Value

The function returns the turning angles in degrees.

# Author(s)

Bart Kranstauber

```
load(system.file("extdata", "move.RData", package="move"), .GlobalEnv)
turnAngleGc(leroy)
```

62 unUsedRecords<-

unUsedRecords<-

Creates unused records data

# Description

A function that assigns locations as unused or returns the unUsedRecords part of the object it could for example be used to remove locations test locations from a track.

## Usage

```
## S4 replacement method for signature '.MoveTrackSingle,logical'
unUsedRecords(obj) <- value
    ## S4 replacement method for signature '.MoveTrackStack,logical'
unUsedRecords(obj) <- value
    ## S4 method for signature '.unUsedRecords'
unUsedRecords(obj,...)
    ## S4 method for signature '.unUsedRecordsStack'
unUsedRecords(obj,...)</pre>
```

# Arguments

obj a Move or MoveStack object

value A logical vector of the same length as the number of locations

... Not used at the moment

#### Author(s)

Marco Smolla

```
data <- move(system.file("extdata","leroy.csv.gz",package="move"))
par(mfrow=2:1)
plot(data, type='b')
unUsedRecords(data)<-as.logical((1:n.locs(data))%%2)
plot(data, type='b')</pre>
```
